Miller Leaman’s Helix Disc filter models are available in three different sizes: 2”, 2” Super and 3”. The filters can be installed in any orientation; however, it is preferable to install them in the inverted position (3/4” flush port at bottom). This helps the filtration system work at its optimum. As water enters the filter housing, a high velocity centrifugal action occurs, spiraling heavier particles (sediment, scale, etc.) away from the disc cartridge, down to the base of the filter. These accumulated particles are then flushed from the filter via the 3/4” flush port connection at the base of the filter (valve not included).

**THE BODY**
The body contains one inlet and two outlets, enabling the filter to be installed at either 90 or 180 degrees. A threaded cap is supplied with the filter to terminate the outlet port not being used. Inlet/outlet connections are available in NPT or Victaulic. The body contains inlet and outlet pressure gauge ports (gauges not included) for monitoring the pressure differential across the filter element which determines when the disc cartridge needs to be removed for maintenance.

**THE CLOSURE**
Manufactured in Type 316 stainless steel, the quick-release clamp assembly is strong and reliable. No tools are necessary to remove the clamp and filter cover when maintenance is required.

**THE DISC**
The three-dimensional disc is ideal for filtering hard particles (such as sediment and scale) and soft fibrous material (such as algae, bugs, cottonwood seed, etc.). The color-coded discs are available in a variety of micron sizes.

**HOW IT WORKS**
1. Dirty water enters the filter housing through the inlet connection.
2. As dirty water passes through the Helix-Element, the water starts to spin at high velocity. This centrifugal action spins the particles away from the disc media, minimizing manual cleaning frequency.
3. As particles are spun down to the base of the filter, they are flushed via the 3/4” female threaded flush port connection.
4. The dirty water passes from the outside to the inside of the discs. The grooves, molded into the surface of the three-dimensional discs, trap the remaining contaminants in the water.
5. After passing through the discs, the filtered water flows upward and exits the filter through one of the outlets. The outlet not being used is terminated with a threaded cap.
TECHNICAL DATA

Flow Rates for a Single Filter Housing
2"/100 GPM Max.*
2" Super/100 GPM Max.*
3"/200 GPM Max.*
Multiple pods are manifolded for higher flow rates
* Maximum flow rates should be derated for high solids loading, particularly for finer disc media.

Inlet/Outlet Configurations
2" and 3" models available with NPT and/or Victaulic inlet/outlet connections
In-line and 90-degree configurations standard
(Filter is supplied with a cap for outlet port not being used)

Pressure Rating
All units rated to 125 PSI

Temperature Rating
All units rated to 140°C F

Construction Materials
Housing: Polyamide
Discs: Polypropylene
Gaskets: EPDM
Filter Pod Clamp: Stainless Steel (Type 316)

Micron Options Available
- 200 Micron (80 Mesh)
- 100 Micron (150 Mesh)
- 130 Micron (120 Mesh)
- 50 Micron (250 Mesh)

Filter Components
A. Band-Clamp Assembly
B. Removable Filter Lid
C. Filter Body
D. Micron/Mesh Data Plate
E. Outlet Gauge Port (Gauge Not Included)
F. Inlet Gauge Port (Gauge Not Included)
G. Filter Disc Cartridge
H. Helix Element
I. O-Ring Seal
J. Cartridge Cover Plate
K. Threaded Wing Bolt

* 50, 100, 130, & 200 micron options available. Please specify disc size when ordering. Example: HD-2SA-130 = 2" NPT Super with 130 - micron discs.

** Disc cartridges for 2" regular models (HD-2NA and HD-2NW) and 2" super models (HD-2SA and HD-2SW) vary in size. The cartridge for the 2" regular models is 15.5" in height; The cartridge for the 2" super models is 20.5" in height. This means that the 2" super models have approximately 40% more surface area for filtration (186 sq. inches vs. 263 sq. inches).
